### **The Autonomic Vision**

#### Wikipedia's definition:

In a <u>self-managing</u> autonomic system, the human operator takes on a new role: instead of controlling the system directly, he/she defines general policies and rules that guide the self-management process. For this process, IBM defined the following four functional areas:

- **Self-configuration**: Automatic configuration of components;
- **Self-healing**: Automatic discovery, and correction of faults;<sup>[6]</sup>
- **Self-optimization**: Automatic monitoring and control of resources to ensure the optimal functioning with respect to the defined requirements;
- **Self-protection**: Proactive identification and protection from arbitrary attacks.

#### **Characteristics of Automatible Analysis**

#### **Continuous Monitoring Through the Lens of a Maturity Model**

**Classic Continuous Monitoring** 

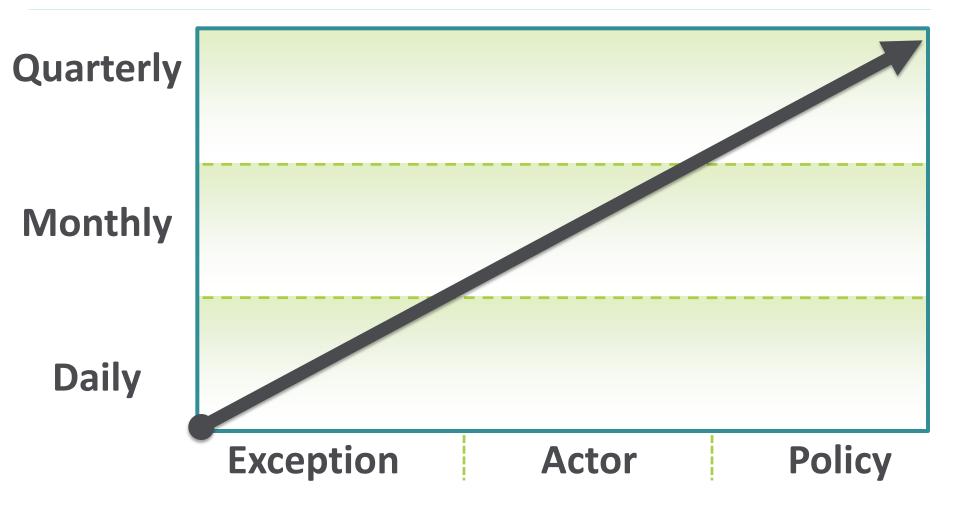

- Strong value and ROI
- Requires high level of maturity in use of analysis

Analysis provided by Consultants

- Used as part of normal business cadence
- Expensive for ongoing use when compared to technology based solutions
