Accounting for and auditing digital assets

50th World Continuous Auditing & Research Symposium
November 6, 2020
Agenda

1. Blockchain ecosystem
2. Enterprise blockchain
3. Digital assets
4. Auditing digital assets
5. Accounting for cryptocurrencies
6. Accounting for stablecoins

Mike Leonardson

## Blockchain ecosystem
Summary of how we view the blockchain ecosystem

<table>
<thead>
<tr>
<th>Pillar 1</th>
<th>Pillar 2</th>
<th>Pillar 3</th>
<th>Pillar 4</th>
<th>Pillar 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entities that hold and/or transact using digital assets</td>
<td>Entities that hold and/or facilitate trading of digital assets on behalf of customers</td>
<td>Entities that create digital assets for sale or distribution to third parties</td>
<td>Entities that use blockchain-based business models</td>
<td>Traditional entities that operate or participate in blockchain processes and/or consortiums</td>
</tr>
<tr>
<td>Examples include investment funds and high-frequency trading companies.</td>
<td>Examples include digital asset exchanges, broker-dealers and custodians.</td>
<td>Examples include entities that sell or distribute stablecoins or other tokens to third parties via initial coin offerings or other means.</td>
<td>Examples include miners, payment service providers, platform providers and digital wallet providers.</td>
<td>These entities leverage blockchain to process and/or record transactions relevant to their financial reporting.</td>
</tr>
</tbody>
</table>

We use these five ‘pillars’ to organize our analysis of the applications of blockchain and their related risks.
Enterprise blockchain use cases (looking forward)

Industry use cases

**Retail**
- **Supply chain** – tracking movement of goods throughout the supply chain cycle
- **Inventory** – provides real-time validation of ownership and inventory levels
- **Warranty** – provides history of origin of all components to determine systemic issues

**Real estate**
- **Title transfer**: movement of land deeds
- **Record of ownership and fractional ownership**: provides distribution platform and record of ownership

**Banking**
- **Payment clearing**: bank-to-bank payments can be completed securely in a fraction of the time
- **Peer-to-peer payments**: can facilitate low-cost payments between two parties
  - e.g., $600m of Litecoin was sent between two wallets for $7 fee

**Energy**
- Verification of green energy certificates tokenized on a blockchain

**Insurance**
- **Underwriting**: adds transparency to premium assessment, enables semi-automatic pricing
- **Claims management**: can code smart contracts for simple claims, so that claim funds can be transmitted automatically if certain conditions are met

**Manufacturing**
- **Logistics** – real-time tracking and payment for tokenized raw materials
- **Equipment management** – potential for shared asset ownership for machinery or equipment
- **Intercompany transactions** – use of smart contracts allows for automated invoicing and settlement of transactions

**Manufacturing**
- **Logistics** – real-time tracking and payment for tokenized raw materials
- **Equipment management** – potential for shared asset ownership for machinery or equipment
- **Intercompany transactions** – use of smart contracts allows for automated invoicing and settlement of transactions
Digital assets

What are digital assets?
- Digital assets include any asset (tangible or intangible) that can be digitally represented on a blockchain, including cryptocurrencies (including stablecoins), utility tokens, security tokens and digital representations of any “real world asset”, including raw materials, consumer and industrial products, real estate or financial instruments.

In what ways do companies engage in digital asset activities?
- Some entities simply hold or transact in cryptocurrencies, others might function as cryptocurrency exchanges or custodians, some might create or issue digital assets for sale or distribution to third parties, while others might participate in the blockchain network, like miners, platform providers or digital wallet providers.

Our focus for today:
- In order to focus on key audit considerations and to demonstrate ways of gathering relevant and reliable audit evidence, our examples today will focus on holding and transacting in cryptocurrencies.
Auditing digital assets
Risk spectrum
Entities that hold or transact in cryptocurrencies (Pillar 1)

Method & frequency of buying or selling
- Peer-to-peer transaction
- Direct purchases from issuer
- Over-the-counter (no intermediary)
- Infrequent transactions
- Transact on a cryptocurrency exchange
- Use a broker-dealer (intermediary)
- Frequent transactions

Method of maintaining custody
- Self-custody
- Cryptocurrency held in a segregated wallet
- Third-party custodian / custody on behalf of others.
- Cryptocurrency held in a joint wallet that also holds others’ cryptocurrency

Private key and cybersecurity
- Private key maintained in cold (offline) storage
- Multi-signature wallet software with strong encryption
- Private key maintained in hot (online) storage
- Wallet software that allows only one signor to authorize transactions
Risk spectrum (cont’d)
Entities that hold or transact in cryptocurrencies (Pillar 1)

Type of cryptocurrency / blockchain

<table>
<thead>
<tr>
<th>Lower risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>More mature and utilized (bitcoin, ether)</td>
</tr>
<tr>
<td>Large number of well-respected code developers / open-source</td>
</tr>
<tr>
<td>Large number of unrelated validating nodes</td>
</tr>
<tr>
<td>Asset and security tokens</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Higher risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less mature and utilized (ICO tokens, privacy coins)</td>
</tr>
<tr>
<td>Small number of code developers / not open-source</td>
</tr>
<tr>
<td>Small number of validating nodes or control not dispersed</td>
</tr>
<tr>
<td>Utility tokens and native cryptocurrencies</td>
</tr>
</tbody>
</table>

Valuation and measurement

<table>
<thead>
<tr>
<th>Lower risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active market for cryptocurrency (i.e., frequent observable transactions)</td>
</tr>
<tr>
<td>Cryptocurrency market with transparent pricing (regulated exchange)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Higher risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inactive market for cryptocurrency</td>
</tr>
<tr>
<td>Cryptocurrency market without transparent pricing (OTC, peer-to-peer, unregulated exchanges)</td>
</tr>
</tbody>
</table>

Source of transactions

<table>
<thead>
<tr>
<th>Lower risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transactions self-initiated</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Higher risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transactions automatically initiated using a smart contract</td>
</tr>
</tbody>
</table>
Identifying incremental audit risks

**Risks related to Company’s books and records**
- All transactions are not recorded (Completeness)
- Cryptocurrency assets recorded do not exist (Existence)
- Transactions recorded did not occur (Existence)
- Entity may not own cryptocurrency (Rights and Obligations)

**Risks related to the blockchain itself**
- All transactions are not recorded on the blockchain (Completeness)
- Blockchains may contain inaccurate information (Completeness)
- Theft, loss, destruction or misappropriation of cryptocurrency (Existence)

**Risks related to the extraction of data using block explorers**
- Block explorers that display blockchain information may not be reliable (Completeness / Existence)
The EY Blockchain Analyzer obtains public blockchain data from an EY node and:

- Assists audit teams with comparing an entity’s cryptocurrency balances and transaction details per the entity’s books and records to the public blockchain
- Provides enhanced analyses compared to third-party block explorer tools by allowing audit teams to examine 100% of an entity’s cryptocurrency transactions and readily identify unusual items or trends

Audit risks that may be addressed using the EY Blockchain Analyzer:

- Block explorers display blockchain information that may not be reliable (C, E)
- Crypto assets recorded do not exist in the blockchain (E)
- All transactions in a particular digital wallet are not recorded (C)
- Transactions recorded did not occur (O)
Each public blockchain evaluation includes:
► A description of how transactions are initiated, recorded, processed and reported in the blockchain
► Identified risks that, if not addressed by controls within the blockchain, could affect the reliability of the transaction-related information in the blockchain
► Identified controls within the blockchain that are designed to mitigate the identified risks
► Procedures to evaluate whether the identified controls have been implemented within the blockchain

We have used EY’s blockchain and cryptography resources to help evaluate these public blockchains.
► It is the responsibility of each audit team to read the evaluation for each relevant public blockchain and determine the degree to which information from the blockchain contributes to the overall body of evidence for an assertion.
► These evaluations are periodically updated.

EY has performed procedures to support the ability of audit teams to use transaction-related information from certain public blockchains as audit evidence.
Accounting for cryptocurrencies
Cryptocurrencies
Accounting for the classification

**Cash and cash equivalent**

- **Definitions:** Cash includes currency and demand deposits. Cash equivalents are short-term, highly liquid investments that are readily convertible to known amounts of cash and represent insignificant risk of changes in value.
- **Not met:** Cryptocurrencies are not accepted as legal tender, nor backed by sovereign governments. Cryptocurrencies do not have maturities and have experienced significant price volatility.

**Financial instrument**

- **Definition:** A financial instrument is cash, ownership interest in entity or a contract that imposes an obligation to deliver or a right to receive cash or another financial instrument.
- **Not met:** Cryptocurrencies are not cash, an ownership interest in an entity, nor do they represent a contractual right/obligation to receive/deliver cash or another financial instrument.

**Inventory**

- **Definition:** Inventory is a tangible property held for sale in the ordinary course of business, in process of production for sale, or to be consumed in production of goods/services.
- **Not met:** Cryptocurrencies are not tangible property.

**Intangible asset**

- **Definition:** Intangible assets are assets (not including financial assets) that lack physical substance.
- **Met:** Cryptocurrencies are nonfinancial assets that lack physical substance.
Cryptocurrencies
Determining the ownership

• When cryptocurrencies are held indirectly through a third party (e.g., a digital wallet service provider), entities must determine the ownership of the cryptocurrencies
• Accounting may be different depending on whether the entity owns the cryptocurrencies

Who is the owner of the cryptocurrencies?

Asset = cryptocurrency (intangible asset under ASC 350)

Asset = a deposit of cryptocurrency at the third party (may be viewed as a hybrid instrument)
Cryptocurrencies generally meet the definition of indefinite-lived intangible assets under ASC 350:

- Measured at cost, less impairment (if any)
- Test for impairment annually and more frequently if “more likely than not” asset is impaired

While cryptocurrencies are held...

Increases in value are not recognized

Decreases in value are recognized
Cryptocurrencies
Fair value measurement - impairment testing

Identify the principal market

All markets cryptocurrency is transacted

Markets entity can “access” at the measurement date

Market with greatest volume and activity

Measurement based on whether principal market is considered an:

Active market

(Price x Quantity)

Inactive market

Prioritize observable inputs
Assess relevance and reliability of prices observed
Cryptocurrencies
Other matters

“Investment companies” (ASC 946)
Subsequently measure cryptocurrency investments at fair value

Hard forks and airdrops
Determining the timing of recognition for newly granted cryptocurrencies

Mining activities
Accounting for transaction fees and “block rewards” received

- Regulatory and accounting environment around cryptocurrencies continues to evolve
- Entities should provide disclosures that help investors understand the effect of cryptocurrency activities on their financial conditions and performance
Accounting for stablecoins
Stablecoins
Accounting classification

- Stablecoins generally link value to an asset or a pool of assets to minimize price volatility.
- They may have different underlying rights and obligations depending on, for example:
  - The types of collateral (e.g., fiat currency, commodity, another crypto asset)
  - The timing of redemption (e.g., any time, a specified time)
  - The redemption terms (e.g., a fee upon redemption)
- The accounting treatment for a stablecoin will ultimately be driven by the specific facts and circumstances, including terms, form, underlying rights and obligations of the stablecoin.
Stablecoins
Accounting classification

Considerations for classification

► What is the purpose of the stablecoin and how does it achieve that purpose?
► What are the rules on the stability mechanism?
► Who is the issuing entity or who comprises the group of entities pooling resources to support the stablecoin?
► What are the rights of the holder and the obligations of the issuing entity?
► Can the stablecoin be traded with parties other than the issuing entity?
► What is the type of asset or collateral backing the stablecoin (e.g., fiat currency, commodity, crypto-asset)?
► How is the collateral verified and perfected? What is the level of collateral (i.e., is it partially, fully or over collateralized)?
► If it is redeemable, how and how often can it be redeemed? Are there significant barriers to redemption (e.g., fees)?
► Does the stablecoin represent an ownership interest in an entity?
► Do any credit or liquidity concerns exist?
Stablecoins
Accounting classification

Example:
A stablecoin issued by an entity (not a bank):
• Serves as a means of payment and store of value
• Has a stated value of USD1
• Is collateralized on a 1:1 basis and held in a segregated bank account by the issuing entity
• Is redeemable for USD1 at any time with no penalty
• Can be traded on certain crypto-asset exchanges
Stablecoins
Accounting classification

Financial instrument

- Definition: a financial instrument is cash, an ownership interest in an entity or a contract that imposes an obligation to deliver or a right to receive cash or another financial instrument.
- Met: stablecoins represent a contractual obligation by the issuer to deliver cash and a right by the holder to receive cash.

Cash

- Definition: consistent with common usage, cash includes currency, demand deposits and other accounts that have the general characteristics of demand deposits with financial institutions.
- Not met: stablecoins are not accepted as legal tender or backed by sovereign governments and generally do not represent demand deposits.

Cash equivalents

- Definition: cash equivalents are short-term, highly liquid investments that are readily convertible to known amounts of cash and represent insignificant risk of changes in value.
- Not met: stablecoins are largely untested; given their nascent nature, they pose legal, regulatory, oversight and operational risks that are not typically presented in highly liquid investments.
